

# Assignment - Backend Engineer

## The Task

Given API endpoint: [https://vintagemonster.onefootball.com/api/teams/en/%team\\_id%.json](https://vintagemonster.onefootball.com/api/teams/en/%team_id%.json) (%team\_id% must be replaced with an **unsigned integer**)

Using the API endpoint, find the following teams by name:

- Germany
- England
- France
- Spain
- Manchester Utd
- Arsenal
- Chelsea
- Barcelona
- Real Madrid
- FC Bayern Munich

Extract all the players from the given teams and render to stdout the information about players alphabetically ordered by name.

Each player entry should contain the following information: **full name**; **age**; **list of teams**.

### Output Example:

```
1. Alexander Mustermann; 25; France, Manchester Utd
2. Brad Exampleman; 30; Arsenal
3. ...
```

### Requirements:

- go >= 1.8

### Delivery of the task:

- Upload the code of your application to GitHub

### FAQ:

- Discovering a valid range of IDs is part of the task
- You do not need to scan all the IDs on the API, only enough to get information about all the teams listed
- Some IDs might break, your code should handle that gracefully, however all teams on the requested list work
